ISOQUANT III

Weighted solids (food, food supplements, minerals or herbs and medicines) and diluted substances (homeopathic remedies, floral essences) supply low-intensity electromagnetic energy (chemiluminescence) that can be carried from ISOQUANT III, by special injectable vials, or by particular hydroalcoholic solutions called ECCIMERI.

ECCIMERI are used in:

- Therapies in withdrawal symptoms from pharmaceutical treatment.
- Therapies to enforce the pharmacological effect of ponderal substances.
- Adjustment therapy to transfer to the Organism:
 - the signals of one or more homeopathic products.
 - electromagnetic signals from therapeutic bioresonance.
- Therapy to desensitize from endogenous allergens (food and medicine allergies)

ISOQUANT III is based mainly upon the “Chamber Theory” ”Wave Guide Theory” and “Aerial Cable Physics”

TECHNICAL FEATURES

- Resonant Frequency Chamber
- Resonant Chamber
- Electronic Timer
- Energy Transfer Dial: Normal / Complementary
- On - Off Switch
- Power: 9 Vcc
- Weight: Kg. 1,65

- Size: cm 32 x 21 x 11

ISOQUANT III is a bioelectronic device and comes with 3 resonance chambers available to the technician to make ECCIMERI® VIALS, PHRE and ECCIMERI® PHRBE BOTTLES.

In the first chamber (SOURCE) resonant energy, produced from sample substances diluted in the hydroalcoholic organic solution contained in the matrix bottle, is collected. This energy is transferred to the two resonance chambers (Destination) and goes to energetically saturate a sterile 5ml. (PHRE) physiological vial for injective therapy and/or drop bottle (PHRBE) which contains a hydroalcoholic solution for oral use.

ISOQUANT III can be linked to a BFB diagnostic system and contains an input for eccymere digital signals..

ISOQUANT III linked to BFB

ISOQUANT III can work only with the original Zener bottles; FM, PHRE, and PHRBE for the following reasons:

Matrix Bottle FM

- Having to transfer only the resonance energy produced by the sample substance contained in the matrix bottle, ISOQUANT III removes (before transferring to the destination chamber) all energy relating to the M.B. and the solvent solution.
- Having to transfer broadband energy (resonance energy of sample substance) required adding, to the solvent solution, a particular Electromagnetic Carrier (E.C.) which would not affect the sample substance. The source chamber was modelled around the M.B. structures.
PHRB vials and PHRBE bottles
- The solutions in PHRB and PHRBE contain the same electromagnetic carrier EC as the MB: this precaution, based on the “ Phase Link Therapy” (PPL which transfers broadband multiple signals) leads to a flawless transmission of energy between SOURCE and DESTINATION chambers.
- The DESTINATION chamber has been modelled around PHRE and PHRBE structures.
